ABSTRACT OF THE DISCLOSURE

In a slide fastener chain sewing apparatus, a continuously supplied slide fastener chain is successively sewn onto a pair of left and right cloth pieces. A chain cutting means cuts the slide fastener chain between the cloth pieces which are moved continuously over a table and suspending from a front end of the table. A sewn product receiving section has sewn product transfer means for receiving, in a lower part, a sewn product cut away from the succeeding cloth piece having the fastener chain sewn thereto. The sewn product transfer means transfers the sewn product to a rear end of the table through a lower space portion of the table.
